Codling Moth Trap & Lure

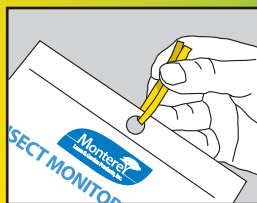

Codling Moth Facts

Codling Moth is a worldwide pest that damages the fruits of apple, pear, walnut and quince during the insect's worm stage. Codling moths can infest every apple in an orchard if left unchecked. Apply appropriate controls at these peak times.

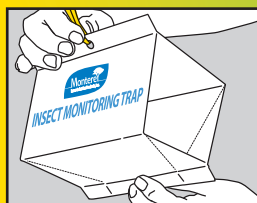

Easy Instructions:

- 1 Attach hanger. Grasp trap by top and bottom flaps.
- 2 Pull apart to form trap (do not touch glue).
- 3 Open lure packet; place one lure on the inside upper surface of the trap. (Do not touch the attractant lure).
- 4 Hang the trap in your fruit or nut tree. Place the trap 1 to 2 feet inside the tree canopy. Place traps in trees 1 or 2 weeks before bud break, in early spring. Check for moths every 2 to 3 days and apply appropriate treatments to control moths. Recycle or dispose of traps when full of insects, or at least every 4 weeks.

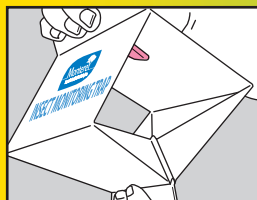

In case of contact, remove glue with vegetable oil.

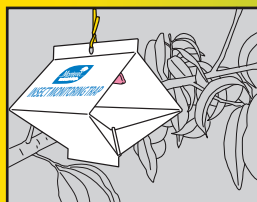

Attach hanger

Pull apart top and bottom

Insert lure, tuck corners

Hang trap in tree
